iii, p. 195). Without going into the homology of the parts in the Culicines and Deinoceratines at the moment, as I will deal with them later, it is obvious that the parts called harpagones in *Mansonia* really correspond with the basal lobes of *Culiseta* and others. Therefore the table, beginning with dichotomy 5, can be amended as follows, bringing in the relationship of the New World and Old World divisions of *Aëdes* as here defined:

21t des de liere defined.
5. Harpagones present
Harpagones absent 8
6. Apical appendages of harpagones multiple
These appendages single
7. A fringe of broad scales on inner edge of side piece Haemagogus
No such fringe present
8. Side pieces without a conical basal lobe, open within,
Aëdes (Old World stock)
Side pieces with such a lobe9
9. Basal lobe with a single terminal rod, often situated at the end of
a process
Basal lobe conical, with several terminal setæMegarhinus.
Orthopodomyia, Culiseta, Culicella, Climacura

A REVISION OF THE AMERICAN SPECIES OF CULEX ON THE MALE GENITALIA

(Diptera, Culicida)

By HARRISON G. DYAR

On a previous page I gave some notes on the relationship of the species of Aëdes as shown by the male genitalia. In a review of the other genera with the object of ascertaining the origin of Culex, it appears that the Anopheles are very distinct. In these the ædæagus is present, simple or with a crown of spines or flattened appendages, and there are no basal chitinous organs whatever. The side pieces are slightly modified, bearing certain stout spines or with small basal lobes; but we find no homology with Culex and must leave the Anopheles aside. In Aëdeomyia, the ædæagus has disappeared, and there is a basal chitinous structure, composed of paired

rods, topped by a single piece. This has been called the uncus, which name we will retain. In the middle of the side piece is a slight lobe, bearing about five stout spines crowded together, situated at the apex of a basal hollow in which the uncus rests. In Uranotania the next step is seen. A second basal organ is present, paired and opposed to the unci, which have now lost the single terminal piece and appear as paired organs. The new organs have been called the harpes; but they are not homologous with those of Culex and others; Uranotania is clearly a side line. We mention the harpes here to show the early stage of a second basal organ. Culiscta is more directly in the line we are following. Here the unci form a basal cylinder or cone, composed of paired parts, but wrapped into a single organ by the revolute margins. True harpes are present in Culiseta, but they are more or less modified. simpler condition is found in Megarhinus. Here the organs are elliptical, concave, more heavily chitinized on one side, the tip dentate. The side pieces have the basal area pouch-like, hollowed to receive the basal organs, the tip of the pouch forming a slight lobe with a group of three stout hairs. From this point Orthopodomyia and Mansonia originated; but they do not lie in the direct line of Culex, one being a generalized form parallel to Culiscta, the other an offshoot. Climacura falls here, the genitalia having the unci undivided. It is interesting, however, as the larva has become practically a true Cule.r. In Culicella, the unci have begun to divide, the harpes remaining as in Culiscta. The larvæ of Culicella have not attained the Culex type, but are still much as in Culiseta. The next link in the chain is shown in Jamesia, an Old World group in which the larvæ are predacious and, therefore, specially modified. The harpes have assumed the Culex type, with a crown of spines, and with this the genus Culex may be said properly to begin. Lutsia goes a step farther, the second plate of the unci being toothed, whereas it is perfectly simple in Jamesia. The side pieces have a process at the apex of the basal hollow, carrying three stout spines; the harpes have a crown of spines and a curved basal arm and the unci are divided into two plates.

The following tables separate first the genera of the tribe Culicini, then the subgenera of Culex and lastly the species of *Culex* as far as the American species are known to me in the male genitalia.

In the monograph¹ the parts called the "harpagones" (vol. iii, p. 224, dichotomy, 3 et seq.) are here identified as unci. I reserve the name harpagones for the structures so denominated in Aëdes. I have omitted dyari and melanurus, commonly classed in Culex, as I have separated them generically under the headings Culicella and Climacura respectively.

It may be remarked that the tribe Sabethini are not distinguishable from the Culicini on genitalic characters (compare the monograph, vol. iii, p. 21, 1915). The lowest members, Joblotia and Lesticocampa, have genitalia essentially as in Megarhinus and Orthopodomyia, the unci only being somewhat modified. In the higher genera, the primitive condition of the basal parts remains; but the side pieces and clasp-filaments are greatly modified, the hollow basal lobes of the former having entirely disappeared. The two series are quite distinctly separated by their mode of evolution.

TABLE OF GENERA OF THE TRIBE CULICINI

1. Ædæagus present; basal membrane long, conical, divided; no basal chitinized appendages	
2. Unci only present, undivided, capitate	
Unci and harpes present, in two pairs	
3. Unci separated, hooked; harpes slender, columnar, opposed to the	
unciUranotænia	
Unci columnar or divided; harpes broad, concave, the tips toothed or spinose, parallel to the unci	
4. Side piece with a hollow basal lobe tipped by stout setæ, modified	l
in the higher forms, but the tip persisting as an appendage of	
the side piece, bearing spines, etc	1
Side piece without a hollow basal lobe, devoid of lobes, except in	
the higher forms, where lobes appear secondarily, but not	
hollow 5	

¹Howard, Dyar and Knab, The Mosquitoes of North and Central America and the West Indies, iii, 1915.

² Coelodiazesis is not distinguishable.

5. Adjacent basal lobe, if present, small and setose, never produced	l
with a single terminal spineAëdes (Old World stock))
Adjacent basal lobe developed into an harpago.	
Aëdes (New World stock)	1
6. Unci undivided	7
Unci divided into two or more outwardly directed plates 1	ı
7. Basal lobe conical with several terminal setæ	3
Basal lobe with a single stout rod, often producedMansonia	2
8. Harpes very long, prominent; unei long, pointedMegarhinu.	S
Harpes and unci moderate)
9. Unci membranous, paired, with an outwardly directed basa	1
chitinization	3
Unci cylindrical, chitinized, revolute 10)
10. Harpes normal, concave, with thickened margins and dentate tip,	
Orthopodomyi	7
Harpes modified, narrow, recurved, prominentCuliseta	3
11. Harpes few-toothed	ı
Harpes with a crown of spines	

The genus Culex divides into two main sections on the genitalic characters. In the first, Cule.r proper, the harpes are tufted at tip with numerous spines, and have a longer or shorter basal arm. The unci form three parts, later four by subdivision of the original second plate. The first plate is generally triangular and heavily chitinized, having a socket near the middle into which a ligament locks that serves to open the plates. This structure is first noticeable in Culicella dyari (Pl. III, fig. 2) where it is rather imperfectly developed. The development in Culex (Jamesia) concolor (Pl. III', fig. 3) is not much better. In Lutsia bigoti (Pl. IV, fig. 6), the structure has improved and it can be seen fully developed in any of the true Culex, as in the case of Culex (Culex) declarator (Pl. III, fig. 4). In Transculicia, the plate is thickened and laminate (Pl. IV, fig. 12). The second plate is seen in membranous form in Culicella dyari (Pl. III, fig. 2); in Jamesia it has become chitinized (Pl. III, fig. 3); in Lutzia, toothed (Pl. IV, fig. 6). This condition in intensified in the true Culex

¹ Including Haemagogus and Psorophora.

 $^{^2 =} Taeniorhynchus$ Arribálzaga according to intention and description, but not according to designation of type.

³ = Theobaldia Neveu-Lemaire, preoccupied by Theobaldius Nevill.

and then again disappears (Pl. III, fig. 5; Pl. IV, figs. 7-11). The third plate arises as a tooth on the second, as in *Culex stenolepis* (Pl. IV, fig. 7). This tooth enlarges, as in *Culex coronator* (Pl. IV, fig. 8), becomes basal, as in *Culex factor* (Pl. IV, fig. 9), separates as in *Culex declarator* (Pl. III, fig. 5), and finally becomes quite detached as in *Culex quinque-fasciatus* (Pl. IV, fig. 11). The fourth plate is small and often hard to find, possibly absent. It occurs in the form of a pair of rods protecting the anus (Pl. III, fig. 1; Pl. IV, fig. 12).

The lobe of the side piece bears primitively three setæ. To these certain others are added and finally the lobe becomes subdivided, but only slightly modified. In one form, *Phalangomyia*, there is a modification of the side pieces, which, though striking, is not fundamental, as the three primitive setæ can be easily traced (Pl. III, fig. 1).

The second general group, Melanoconion, is much more modified. The harpes have the tip comb-shaped, the spines in a single row, the basal arm represented by a rounded process or absent. The divisions of the unci are complex, and I am not sure of their homology. The difficulty of the study is increased by the fact that clear mounts are not always to be had of critical species of which the material may be scanty. Apparently there are primitively four plates as in Culex (Tinolestes) latisquama (Pl. IV, fig. 14) and Culex (Micräedes) chalcocorystes (Pl. IV, fig. 15). The first is a large outer sheathing plate, shown disjointed from its socket in the figure; the second a spatulate structure; the third large and furcate; the fourth rod-like with modified tip. In Deinocerites, the outer plate seems to be gone, the second elongated (Pl. IV, fig. 13). In the higher forms, the fourth plate seems to have disappeared, while the second assumes the form of a long hook, recurved around the other parts, as for example in Culex (Micraëdes) bisulcatus (Pl. IV, fig. 16) and Culex (Charoporpa) educator (Pl. IV, fig. 17).

The lobe of the side piece in *Melanoconion* begins simply, but becomes complex and subdivided in the higher groups, notably in *Charoporpa* and *Carrollia*.

The four main groups of Culex separate as follows:

1.	Harpes tufted, the basal process, when present, arm-like; first uncal
	plate with an opening ligament
	Harpes comb-shaped, the basal process not arm-like; first uncal
	plate jointed in a socket or absent
2.	Side piece essentially unmodified
	man and the state of the state

3. First uncal plate absent, the second produced and spatulate,

Deine

First uncal plate present, forming an outer sheath....Melanoconion

In more detail, with the characters shifted a little in order to be more easily followed, the subgenera separate as below.

In the following separation of species, it has been my aim to recognize only such species as differ appreciably in the genitalia and I have accordingly united all those with similar genitalia unless they showed appreciable differences in adult coloration or larval structure. In some instances I may have united really distinct species, owing to the fact that differences in larvæ or habits were unknown to me. But even allowing for this, there remains a very considerable change from the account given in the monograph in the direction of the reduction in the number of species to be recognized. In the monograph, we relied on the coloration of the adults and larval differences, and we carried out this scheme consistently, at the same time overdoing it a little. The study of the genitalia has led me to make comparisons where we had not suspected that comparisons should be made, and has resulted in the correction of certain errors of observation. When these corrections have been made and a little more latitude is allowed for variation in adult coloration, the account in the monograph will not differ greatly from that here set forth. The errors in that work all lie in the direction of too great subdivision of species and are therefore most easily to be corrected. It is perhaps unfortunate that a more intensive study of the male genitalia of Culex could not have been undertaken before that volume of the monograph went to press; but multiplicity of duties at the time rendered it impossible.

TABLE OF SUBGENERA OF THE GENUS CULEX

1.	Lobe of side piece with three stout setæ or appendages, neither more nor less (not counting a few unmodified setæ from the general vestiture)
	Appendages of side piece setaform or rod-like
	Unci of two unmodified plates
4.	Central rod mushroom-shaped; marginal ones very stout, Tinolestes
	Appendages in a triangle, the upper two blade-like, the lower spine-like
5.	Harpes spinose with basal arm
6.	Harpes tufted
7.	Lobe of side piece divided into a triangular setose portion with a separate articulation, two setæ on a lobe and a club-shaped appendage beyond
Q	Lobe of side piece with more than three appendages9
0.	Lobe of side piece with less than three appendages
9.	Plates 2 and 3 of unci absent, 1 and 4 present
10.	Fourth plate of the unci quadrately angled, ending in a retrose tooth
	Fourth plate of unci without a retrose tooth
11.	Basal division of lobe of side piece a long arm bearing terminal setæ or leaves
12.	Clasp filament simple, the spine appendiculate
	Clasp filament modified
13.	Outer division of lobe of side piece with six or more stout setæ
14	Clasp filament not swollen at tip
. 11	Clasp filament swollen at tip
15.	Clasp filament elongated, with snout-like terminationChæroporpa This part bluntly rounded with subspherical tipMochlostyrax

GENITALIA OF CULEX

GENITALIA OF CULEX

Genus CULEX Linnaeus

Subgenus JAMESIA Christophers

Jamesia Christ., Sci. Mem. Med. Ind., n.s., No. 25, 12, 1906.

There are no American species in this subgenus, which was proposed for *Culex tigripes* Grandpré and *C. concolor* Robineau-Desvoidy of India.

Subgenus LUTZIA Theobald

Lutsia Theobald, Mon. Culic., iii, 155, 1903.

TABLE OF SPECIES

1. Tooth on basal section of second plate of unci short and blunt,

bigoti

This tooth long and sharp......allostigma

1. Culex (Lutzia) bigoti Bellardi.

Lutzia bigoti Howard, Dyar and Knab, Monogr., iii, 468, 1915.

2. Culex (Lutzia) allostigma Howard, Dyar and Knab.

Lutzia allostigma Howard, Dyar and Knab, Monog., iii, 471, 1915.

Subgenus PHALANGOMYIA Dyar and Knab

Phalangomyia Dyar and Knab, Ins. Ins. Mens., ii, 58, 1914.

3. Culex (Phalangomyia) debilis Dyar and Knab.

Phalangomyia debilis Dyar and Kuah, Ins. Ins. Mens., ii, 58, 1914.

The side pieces are peculiarly and highly evolved (Pl. III, fig. 1), but the basal parts are of a simple *Culex* type, much as in *Lutsia*. In the figure, the first uncal plates are shown thrown back, exposing the second and fourth plates; no trace of the third plate has developed.

Subgenus CULEX Linnaeus

Cule.r Linnaens, Syst. Nat., 10th ed., 602, 1758.

TABLE OF SPECIES

1.	Lobe of side piece entire	2
	Lobe of side piece divided	12
2.	Lobe of side piece with three rods, a leaf and a seta	3
	Lobe of side piece with additional appendages	4

3.	Second plate of unci with the tooth arising from the base; a radiat-
	ing pecten in the angleinflictus, factor
	This plate with the tooth arising in the middle; no pecten at the
	angle stenolepis
4.	Lobe of side piece with three rods, a seta or filament, a leaf and
	a seta 5
	This part with additional appendages 9
5,	Second plate of unei with two broad arms and a central mass of
	close denticlescorniger
	This plate not so formed
6.	Second plate of unci with two long arms with a number of teeth
	between; a long tooth from basal part
	This plate not so formed
7.	Upper limb of second plate of unci denticulate,
	tarsalis, stigmatosoma, cumimetes
	This limb entireerythrothorax, salinarius, janitor, secutor
	This limb with a double clasp on a pediclemollis, equivocator
8.	Second plate of unei of three large teeth
	This plate quadrate, denticulate on upper halfinterrogator
	This plate of two blunt teethrestuans
9.	Lobe of side piece with five rods, a leaf and a setareflector
	This lobe with three rods, two setæ, a filament, a leaf and a
	seta 10
10.	Second plate of unci toothed as in stenolepispinarocampa
	This plate not toothed
11.	Fourth plate of unci upright, pointedquinquefasciatus
	This plate oblique and tubularpipiens
12.	Lobe of side piece without a leaf-like appendage 13
	A leaf present on a separate piece
13.	Harpes weak with basal recurved branch
	Basal branch obsolete
14.	Lower part of lobe of side piece with three rodscoronator
	This part with 8 to 13 setæousqua
15.	Second plate of unci with two arms and group of small teeth be-
	tween; third plate a stout toothsphinx
	This plate without arms; third plate distinct and broadextricator
4.	Culex (Culex) inflictus Theobald.
	Culex inflictus Theobald, Mon. Culic., ii, 115, 1901.
	Culex scholasticus Theobald, Mon. Culic., ii, 120, 1901.
	Culex microsquamosus Grabham, Can. Ent., xxxvii, 407, 1905.
	Culex prasinopleurus Martini, Ins. Ins. Mens., ii, 68, 1914.
	var. carmodyae Dyar and Knab.
	Culex carmodya Dyar and Knab, Journ. N. Y. Ent. Soc., xiv,
	210, 1906,

var. palus Theobald.

Culex palus Theobald, Mon. Culic., iii, 194, 1903.

Culex similis Theobald, Mon. Culic., iii, 207, 1903.

Culex regulator Dyar and Knab, Journ. N. Y. Ent. Soc., xiv, 213, 1906.

C. inflictus has the abdomen without bands; in palus narrow basal segmental bands are present; in carmodyæ there are very faint brown rings at both ends of the tarsal joints. This variety seems confined to Santo Domingo, although not all the specimens from there are so affected. The larva of microsquamosus is really spiculate and not glabrous, as given in the monograph by error; the proboscis also is not swollen at the tip. In the larva of carmodyæ there were probably four hair-tufts on the tube, one having been detached and not three as given in the monograph. They agree entirely otherwise.

5. Culex (Culex) factor Dyar and Knab.

Culex factor Dyar and Knab, Jour. N. Y. Ent. Soc., xiv, 212, 1906. Culex aikenii Dyar and Knab (larvæ only), Proc. U. S. Nat. Mus., xxxv, 61, 1908 (not Gnophodeomyia aikenii Aiken).

Culex proximus Dyar and Knab, Proc. Ent. Soc. Wash., xi, 38, 1909.

Culex lachrimans Dyar and Knab (in part), Smiths. Misc. Colls., quart. iss., lii, 259, 1909.

The genitalia are not distinguishable from *inflictus*; but the adult female has basal abdominal bands not widened at the sides, although they may be absent. The larva has the air tube a little shorter than in *inflictus*; the third pair of head hairs are more approximate. In *proximus* the skin of the larva is really spicular, not glabrous as erroneously stated in the monograph.

6. Culex (Culex) stenolepis Dyar and Knab.

Culex stenolepis Howard, Dyar and Knab, Monog., iii, 249, 1915.

7. Culex (Culex) pinarocampa Dyar and Knab.

Culex pinarocampa Howard, Dyar and Knab, Monog., iii, 251, 1915.

8. Culex (Culex) corniger Theobald.

Culex corniger Howard, Dyar and Knab, Monog., iii, 240, 1915.

The genus *Trichopronomyia* Theobald is available for this species, but, although it is unique, I do not think the distinctions are strong enough for a subgeneric separation.

9. Culex (Culex) tarsalis Coquillett.

Culex tarsalis Howard, Dyar and Knab, Monog., iii, 230, 1915.

10. Culex (Culex) stigmatosoma Dyar.

Culex stigmatosoma Howard, Dyar and Knab, Monog., iii, 236, 1915.

11. Culex (Culex) eumimetes Dyar and Knab.

Culex eumimetes Howard, Dyar and Knab, Monog., iii, 238, 1915.

The genitalia agree with tarsalis while the adult is colored like stigmatosoma, though there is nothing very decisive about this as the difference between tarsalis and stigmatosoma is slight, consisting only in the difference in the number of teeth on the second uncal plate, which varies. Probably eumimetes is the same as stigmatosoma; the larval differences on which the species was founded and which we repeat in the monograph with distinctly less emphasis do not exist.

It will be noted that *duplicator*, which falls here on coloration, is entirely unrelated on genitalic characters, thus confirming the value of the different wing-scaling.

12. Culex (Culex) erythrothorax Dyar.

Culex crythrothorax Howard, Dyar and Knab, Monog., iii, 315, 1915.

13. Culex (Culex) salinarius Coquillett.

Culex salinarius Howard, Dyar and Knab, Monog., iii, 373, 1915.

14. Culex (Culex) janitor Theobald.

Culex janitor Howard, Dyar and Knab, Monog., iii, 258, 1915.

The larvæ differ from allied species in having the antennæ without the "notch," agreeing in this with restuans.

15. Culex (Culex) secutor Theobald.

Culex secutor Theobald, Mon. Culic., ii, 321, 1901.

Culex lamentator Dyar and Knab, Journ. N. Y. Ent. Soc., xiv, 219, 1906.

Culc.r toweri Dyar and Knab, Journ. N. Y. Ent. Soc., xv, 13, 1907.

The three names were given to specimens from Jamaica, Santo Domingo, and Porto Rico, respectively, but I think only one species is represented, doubtless occurring in Cuba also. The larva has the tufts of the air tube crowded back along the ventral line as in *tarsalis*, the normal symmetry being thereby destroyed.

16. Culex (Culex) mollis Dyar and Knab.

Culex mollis Howard, Dyar and Knab, Monog., iii, 267, 1915.

Hardly distinguishable from *equivocator*; but the adult female has basal abdominal white bands, which are absent in the other species. The specimens are from Trinidad.

17. Culex (Culex) equivocator Dyar and Knab.

Culex equivocator Dyar and Knab, Journ. N. Y. Ent. Soc., xv, 203, 1907.

Culex elocutilis Dyar and Knab, Smiths. Misc. Colls., quart. iss., lii, 255, 1909.

Described from Panama. Specimens are before me extending the range to British Guiana (H. W. B. Moore).

18. Culex (Culex) declarator Dyar and Knab.

Culex declarator Dyar and Knab, Journ. N. Y. Ent. Soc., xiv, 211, 1906.

Culex jubilator Dyar and Knab, Journ. N. Y. Ent. Soc., xv, 201, 1907.

Culex vindicator Dyar and Knab, Smiths. Misc. Colls., quart. iss., lii, 255, 1909.

Culex dictator Dyar and Knab, Smiths. Misc. Colls., quart. iss., lii, 255, 1909.

var. proclamator Dyar and Knab.

Culex proclamator Dyar and Knab, Journ. N. Y. Ent. Soc., xiv, 211, 1906.

Culex inquisitor Dyar and Knab, Journ. N. Y. Ent. Soc., xiv, 211, 1906.

Culex revelator Dyar and Knab, Journ. N. Y. Ent. Soc., xv, 202, 1907.

The adult female has the abdomen with basal segmental white spots, sometimes extended as dull whitish bands; but the central spot whiter or produced. In the male there are even white bands. The genitalia have a peculiar second uncal plate, consisting of three stout claws from a circular base. The larva has the head hairs in threes or four-three, the skin spicular, the air-tube with three tufts, the middle one moved out of line; pecten commonly long, but not uniformly so.

In our original descriptions of declarator, proclamator and inquisitor, from larvæ, three lengths of the air-tube pecten are shown; but these characters become less distinct the more specimens are examined. Nevertheless, two races seem indicated. In declarator proper, the pecten is short, the teeth about 4 x 1 and about 14 in number. It occurs from Trinidad to Panama, including the Lesser Antilles, specifically Dominica and St. Thomas. In proclamator the pecten is longer, the teeth 5 x 1 or over and 18 to 20 in number. It occurs from Mexico to Panama, and the two forms may coalesce in the latter region.

The exact position of the hair tufts on the air tube seems to be unreliable. The character found in the adult of the white tip of the last tarsal joint being present or absent seems to be variable. The banding of the abdomen as given in the monograph, I do not verify on reëxamination.

19. Culex (Culex) interrogator Dyar and Knab.

Culex interrogator Howard, Dyar and Knab, Monog., iii, 417, 1915.

Quite erroneously placed in the monograph in the *Melano-conion* group. The proboscis should not have been taken as "swollen at the tip," or, if so, then the character is worthless, for this is a true *Culex*.

20. Culex (Culex) restuans Theobald.

Culex restuans Howard, Dyar and Knab, Monog., iii, 333, 1915.

21. Culex (Culex) reflector Dyar and Knab.

Culex reflector Howard, Dyar and Knab, Monog., iii, 419, 1915. The same remark applies as for interrogator.

22. Culex (Culex) quinquefasciatus Say

Culex quinquefasciatus Howard, Dyar and Knab, Monog., iii, 345, 1915.

Culex revocator Dyar and Knab, Smiths. Misc. Colls., quart. iss., lii, 256, 1909.

Culex aseyehæ Dyar and Knab, Ins. Insc. Mens., iii, 112, 1915.

The genitalia furnish no characters for considering revocator as a distinct species peculiar to Jamaica.

23. Culex (Culex) pipiens Linnaeus.

Culex pipiens Howard, Dyar and Knab, Monog., iii, 360, 1915. Culex flavipes Macquart, Dipt. Exot., i, part 1, 35, 1838. Culex flavipes Brèthes, Anal. Mus. Nac. Hist. Nat. B. A., xxviii. 210, 1916.

There seems now no doubt that *pipiens* is more widely distributed than given by us in the monograph. Not only does it occur in California, as shown by Mr. Knab and myself (Ins. Ins. Mens., v, 178, 1917), but the excellent figures recently published by Juan Brèthes show that it is widespread in Chile and Argentina, under the name *Culex flavipes*. The name *flavipes* must therefore be hereafter cited in the synonymy of *pipiens* instead of *quinquefasciatus*, as in the monograph (vol. iii, p. 345, 1915).

24. Culex (Culex) coronator Dyar and Knab.

Culex coronator Howard, Dyar and Knab, Monog., iii, 286, 1915.

25. Culex (Culex) ousqua, new species.

Male genitalia. Lobe of side piece divided, the inner portion large and conical, bearing 10 to 13 hairs, no spines being distinguishable; outer portion small, distinct, bearing about five hairs. Otherwise as in *coronator*, the second plate of unci commonly with fewer teeth, four to seven.

The male adult has faint white rings at both ends of the tarsal joints, the last hind tarsal white; abdomen with white basal segmental bands, mesially produced, as in *coronator*.

Type, male, No. 21602, U. S. Nat. Mus.; Panama (Busck 181.1). Also Canal Zone, Panama (Jennings 52) and Culebra, Canal Zone, Panama (L. H. Dunn, C-77).

The larva has several spines on one side of the air tube subapically.

26. Culex (Culex) duplicator Dyar and Knab.

Culex duplicator Howard, Dyar and Knab, Monog., iii, 235, 1915.

27. Culex (Culex) extricator Dyar and Knab.

Culex extricator Howard, Dyar and Knab, Monog., iii, 325, 1915.

28. Culex (Culex) sphinx Howard, Dyar and Knab.

Culex sphiux Howard, Dyar and Knab, Monog., iii, 301, 1915. Culex sphiux Dyar and Knab, Ins. Ins. Mens., iii, 114, 1915.

Subgenus NEOCULEX Dyar

Neoculex Dyar, Proc. Ent. Soc. Wash., vii, 45, 48, 1905.

TABLE OF SPECIES

- 29. Culex (Neoculex) saxatilis Grossbeck.

Culex territans Howard, Dyar and Knab, Monog., iii, 293, 1915.

30. Culex (Neoculex) derivator Dyar and Knab.

Culex derivator Howard, Dyar and Knab, Monog., iii, 290, 1915.

Subgenus CACOCULEX, new

With the characters of the table. Type, Culex habilitator Dyar and Knab.

31. Culex (Cacoculex) habilitator Dyar and Knab.

Culex habilitator Howard, Dyar and Knab, Monog., iii, 262, 1915. Culex eremita Howard, Dyar and Knab, Monog., iii, 261, 1915.

Subgenus TRANSCULICIA Dyar

Transculicia Dyar, Ins. Ins. Mens., v, 184, 1917.

32. Culex (Transculicia) eleuthera Dyar

Culex (Transculicia) eleuthera Dyar, Ins. Ins. Mens., v, 184, 1917.

Subgenus DEINOCERITES Theobald

Deinocerites Theobald, Mon. Culic., ii, 215, 1901.

Brachomyia Theobald, Mon. Culic., ii, 343, 1901.

Dinomimetes Knab, Journ. N. Y. Ent. Soc., xv, 120, 1907.

Dinanamesus Dyar and Knab, Smiths. Misc. Colls., quart. iss., lii, 259, 1909.

Some of the *Culex* addicted to crab-holes have developed elongated antennal joints, on which genera and even higher groups have been founded. From the point of view of the genitalia, this appears to be an over-valuation. However, there are some good larval characters, and *Deinocerites* may be conveniently considered a genus. But I do not think that *Dinominates* and *Dinanamesus* will hold.

TABLE OF SPECIES

The or others
1. Claws of the clasp filament equal 2
These claws unequal 4
2. Teeth of harpe about 15
Teeth of harpe over 20melanophylum
3. Harpal plate longer, exceeding the lobes of side piececancer
This plate shorter, not exceeding lobe of side piecetroglodytus
4. Third uncal plate simple; second with two revolute spinesspanius
Second plate with a horn and many lateral spines; third plate
spatulate 5
5. Harpal plate long and slender beyond baseepitedeus
This plate shorter, not exceeding the lobe of side piecepseudes
33. Culex (Deinocerites) spanius Dyar and Knab.
Dinanamesus spanius Howard, Dyar and Knab, Monog., iii, 213,
1915.
34. Culex (Deinocerites) epitedeus Knab.

Dinomimetes epitedeus Howard, Dyar and Knab, Monog., iii, 197, 1915.

35. Culex (Deinocerites) pseudes Dyar and Knab.

Deinocerites pseudes Howard, Dyar and Knab, Monog., iii, 210, 1915.

36. Culex (Deinocerites) troglodytus Dyar and Knab.

Deinocerites troglodytus Howard, Dyar and Knab, Monog., iii, 206, 1915.

37. Culex (Deinocerites) cancer Theobald.

Deinocerites cancer Howard, Dyar and Knab, Monog., iii, 201, 1915.

38. Culex (Deinocerites) melanophylum Dyar and Knab.

Deinocerites melanophylum Howard, Dyar and Knab, Monog., iii, 207, 1915.

Subgenus TINOLESTES Coquillett

Tinolestes Coquillett, Proc. Ent. Soc. Wash., vii, 185, 1905.

39. Culex (Tinolestes) latisquama Coquillett.

Culex latisquama Howard, Dyar and Knab, Monog., iii, 303, 1915.

Subgenus MICRAEDES Coquillett

Micraëdes Coquillett, Proc. Ent. Soc. Wash., vii, 185, 1905.

TABLE OF SPECIES

1. First plate of unci very broad, notched, and jointed to second plate, chalcocorystes

This plate triangulate, scarcely modified.....bisulcatus This plate attenuate on the outer half and curled.....restrictor

40. Culex (Micraëdes) chalcocorystes Martini.

Culex chalcocorystes Martini, Ins. Ins. Mens., ii, 70, 1914.

The unci are almost exactly as in latisquama, and on that basis this species might with propriety be placed in *Tinolestes*. The present location is based on the structure of the lobe of the side piece.

41. Culex (Micraëdes) bisulcatus Coquillett.

Culex bisulcatus Howard, Dyar and Knab, Monog., iii, 306, 1915.

42. Culex (Micraëdes) restrictor Dyar and Knab.

Culex restrictor Howard, Dyar and Knab, Monog., iii, 331, 1915.

This species has affinities with Melanoconion and might with almost equal propriety be placed there.

Subgenus ISOSTOMYIA Coquillett

Isostomyia Coquillett, U. S. Dept. Agr., Bur. Ent., Tech. ser. 11, 16, 24, 1906.

This name is here employed in the sense intended by Coquillett, and not in that which his citation of type would imply.

43. Culex (Isostomyia) conservator Dyar and Knab.

Culex conservator Howard, Dyar and Knab, Monog., iii, 308, 1915.

This species is congeneric with *restrictor* as far as uncal development goes or lobes of side piece. It is separated on account of the modification of the clasp filament.

Subgenus MELANOCONION Theobald

Melanoconion Theobald, Mon. Culic., iii, 238, 1903.

TABLE OF SPECIES

- 44. Culex (Melanoconion) atratus Theobald.

 Culex atratus Howard. Dyar and Knab, Monog., iii, 388, 1915.

45. Culex (Melanoconion) falsificator Dyar and Knab.

Culex falsificator Howard, Dyar and Knab, Monog., iii, 425, 1915.Culex agitator Howard, Dyar and Knab (in part, adult only), Monog., iii, 384, 1915.

This Cuban species comes very close to *atratus* from Jamaica and may not be distinct. The apparent genitalic difference may be due to the position of the parts on the slide. The colorational differences given in the monograph appear unreliable. The adults associated with the larvæ of *agitator* do not appertain to that species.

Subgenus CHŒROPORPA, new1

With the characters of the table. Type, Culex anips Dyar.

TABLE OF SPECIES

¹ Gnophodeomyia Theobald, type inornata Theobald (= aikenii Aiken), may be an older name for the subgenus Choeroporpa or a synonym of Melanoconion.

	Clasp filament narrowed at tip, the terminal spine widened and appendiculate
2.	Anterior crest of clasp filament of appressed or consolidated spines. 3
	This crest composed of fine hairs
3.	Terminal spine of clasp stout; anterior crest solidcrraticus
	This spine delicate; anterior crest of compressed spinespeccator
4.	Outer division of lobe of side piece with a leaf-like appendage 5 Without this structure
5.	The leaf large and expanded, exceeding the accompanying setæ. 6
	The leaf small and oval, not exceeding the accompanying setæ. 8
6.	Harpes with delicate hair-like pecten, the marginal tooth stout,
	mutator
7	Harpes with a distinct comb
٠.	of side piece adjacent to setæ
	Harpal comb of about 6 teeth; the leaf free from setæinvocator
8.	Outer division of lobe of side piece with the leaf adjacent to the
	two filaments on basal margin; second plate of unci bifid,
	Conspirator This leaf adjacent to the three filaments on the distal margin;
	second plate of unci trifidbastagarius, carcinophilus
9.	Second plate of unci without an adjacent pair of hooks or
	spines 10
10	This plate with hooks or spines
10.	Limbs of second plate of unci subequal
	right angleselcvator
11.	Second plate of unci with a hook on inner margineducator
	This plate with a spine on each margin
12.	Apical portion of second plate quadrate and denticulateiolambdis This portion smooth and archateinhibitator
	This portion smooth and archate
16	. Culex (Chœroporpa) anips Dyar.
	Culex anips Dyar, Ins. Ins. Mens., iv, 48, 1916.
	Culex (Melanoconion) anips Dyar and Knab, Ins. Ins. Mens.,
	v, 180, 1917.
47	. Culex (Chœroporpa) erraticus Dyar and Knab.
	Culcx (Mclanoconion) erraticus Dyar and Knab, Ins. Ins. Mens.,
	v, 179, 1917.
18	. Culex (Chœroporpa) peccator Dyar and Knab.
	Culex (Melanoconion) peccator Dyar and Knab, Ins. Ins. Mens.,
	v 170 1017

49. Culex (Chœroporpa) mutator Dyar and Knab.

Culex mutator Howard, Dyar and Knab, Monog., iii, 422, 1915.

50. Culex (Chœroporpa) leprincei Dyar and Knab.

Culex leprincei Howard, Dyar and Knab, Monog., iii, 397, 1915. Culex trachycampa Howard, Dyar and Knab, Monog., iii, 329, 1915.

The genitalia and larvæ of trachycampa and leprincei are alike. The separation of the adults in the monograph was due to an error of observation of the female proboscis, being called swollen in one case and not in the other—an error very easy to make.

51. Culex (Chœroporpa) invocator Pazos.

Culex invocator Howard, Dyar and Knab, Monog., iii, 323, 1915.

52. Culex (Chœroporpa) conspirator Dyar and Knab.

Culex conspirator Howard, Dyar and Knab, Monog., iii, 410, 1915.

53. Culex (Chœroporpa) carcinophilus Dyar and Knab.

Culex carcinophilus Howard, Dyar and Knab, Monog., iii, 412, 1915.

I have only one male mounted in poor condition and indistinguishable from bastagarius; but the larvæ differ obviously.

54. Culex (Chœroporpa) bastagarius Dyar and Knab.

Culex bastagarius Howard, Dyar and Knab, Monog., iii, 424, 1915.

55. Culex (Chœroporpa) chrysonotum Dyar and Knab.

Culex chrysonotum Howard, Dyar and Knab, Monog., iii, 310, 1915.

56. Culex (Chœroporpa) inhibitator Dyar and Knab.

Culex inhibitator Howard, Dyar and Knab, Monog., iii, 391, 1915

57. Culex (Chœroporpa) educator Dyar and Knab.

Culex educator Dyar and Knab, Journ. N. Y. Ent. Soc., xiv, 217, 1906.

Culex elevator Howard, Dyar and Knab (in part), Monog., iii, 414, 1915.

Culex apateticus Howard, Dyar and Knab (in part), Monog., iii, 321, 1915.

58. Culex (Chœroporpa) elevator Dyar and Knab.

Culex elevator Dyar and Knab, Journ. N. Y. Ent. Soc., xiv, 217, 1906.

Culex elevator Howard, Dyar and Knab (in part), Monog., iii, 414, 1915.

Culex apateticus Howard, Dyar and Knab (in part), Monog., iii, 321, 1915.

In the monograph we united elevator and educator; but the genitalia are obviously different. On the other hand, we created the new species apateticus, based on a mixture of elevator and educator. The types of apateticus are three of Jennings' No. 498, the mounted male being elevator, plus two of Jennings' No. 454 and one of Jennings' No. 522, the two mounted males being educator. We placed these in the monograph with hesitator, a Mochlostyrax, but this also was placed wrongly. Both species should have the female proboscis swollen at the tip, but we have put them in the "straight proboscis" section.

59. Culex (Chœroporpa) iolambdis, new species.

Male genitalia.—Comb of harpe with about eight teeth; second plate of unci with a horn on either side, the tip quadrately terminated and denticulate; outer division of lobe of side piece obsoletely subdivided, the proximal portion bearing a hooked filament; at the base is inserted a broad filament but not leaf-shaped, and on a scarcely distinguishable prominence below are three crooked filaments. Clasp filament not strongly swollen, the tip attenuated, truncate, with snout-like termination; a groove at end and straight oblique groove across; setæ very obscure; cresting pile very small, reaching to near end of snout.

Only one slide is before me; near *educator*, of which I hope it is not a distorted specimen.

The adult has the tarsi wholly black; palpi exceeding the proboscis, black, the last two joints sparsely and evenly haired. Abdomen entirely black dorsally with bronzy luster; the venter appears wholly black.

Type, male, No. 21603, U. S. Nat. Mus.; Panama, bred by Mr. A. Busck but at present without label.

It is possible that this is the adult of Culex investigator Dyar and Knab, described from Mexico, the adult being un-The larva of investigator falls in the table with known. inhibitator, with the adult of which iolambdis is allied.

Subgenus MOCHLOSTYRAX Dyar and Knab

Mochlostyrax Dyar and Knab, Journ. N. Y. Ent. Soc., xiv, 223, 1906.

TABLE OF SPECIES

1.	Second plate of unci with a distinct radial pecten in one angle of the plate
	Without this character
2.	Basal lobes of penultimate segment minute, pointed, hairless,
	reductor
	These lobes larger with a few or many hairs
3.	Basal lobe small, few haired; harpes with 6 teeth 4
	Basal lobe large, many haired; harpes with 8 teethhesitator
4.	Tip of clasp filament foot-shaped
	Tip of clasp filament roughly ellipticalpilosus
5.	Outer division of lobe of side piece forked, bearing many flat
	filaments but no leaf
	This part entire, bearing two leaves and two filaments,
	peribleptus, moorei

60. Culex (Mochlostyrax) reductor Dyar and Knab.

Culex reductor Howard, Dyar and Knab, Monog., iii, 399, 1915.

61. Culex (Mochlostyrax) hesitator Dyar and Knab.

Culex hesitator Howard, Dyar and Knab, Monog., iii, 319, 1915. Placed in the wrong section in the monograph. The female proboscis should be swollen.

62. Culex (Mochlostyrax) floridanus Dyar and Knab.

Culex (Mochlostyrax) floridanus Dyar and Knab, Ins. Ins. Mens., v, 180, 1917.1

63. Culex (Mochlostyrax) pilosus Dyar and Knab.

Culex pilosus Howard, Dyar and Knab, Monog., iii, 393, 1915.

¹ Fresh material shows that the Cuban species (agitator = cubensis = mastigia) must be again separated from the Floridian species (floridanus = deceptor) on adult colorational characters.
